EFL Pre-service Teachers' Satisfaction with Online English Learning and Their Academic Achievement

ARTICLE INFO

Keywords:

Online learning, EFL pre-service teachers' satisfaction, academic achievement, correlation

DOI:

<http://dx.doi.org/10.21093/ijeltal.vxxixx.xxx>

ABSTRACT

As a result of the pandemic's social distancing strategy, learning activities have transitioned from traditional gatherings to online meeting modes including English Language Teaching (ELT) activities. The concerns surrounding the impact of online learning on students' satisfaction and academic performance need to be addressed. The aim of this study was to investigate the relationship English Foreign Learning (EFL) Pre-service Teachers' satisfaction with online English learning and their academic performance. A correlational research strategy was used in conjunction with a quantitative technique. A convenience sample strategy was used to recruit 132 EFL pre-service teachers from a private university in Yogyakarta. A Google Form was used to provide a twenty-item questionnaire to the responders. The second investigation likewise employed students' GPA as an instrument. The Kendall's Tau correlation value (-value) of this study was 0.023, with a significance value of 0.704 ($0.704 > 0.05$). It suggests that the alternative hypothesis has been ruled out. Consequently, the research revealed a lack of statistically significant correlation between the level of satisfaction that EFL Pre-service Teachers experience with online English learning and their academic performance.

1. Introduction

Online English learning can be conducted synchronously or asynchronously. Both rely on internet technology to facilitate interactive communication between students and teachers, regardless of their location (Faize & Nawaz, 2020). Meanwhile, prior to the pandemic, several colleges used online learning systems (LMS) to help their students study. During the pandemic, the government's distant learning policy makes the asynchronous teaching and learning process using LMS even more successful. This rule is important for all educational levels, particularly those who have never utilized online learning previously (Padmo et al., 2020). However, not all teachers at any level were prepared to perform online learning, which produces a number of difficulties. They include a lack of online learning approaches as well as supporting resources such as computers and internet access. In response to the urgency, preparation and implementation were pushed back (Surahman, 2020). Consequently, teachers and students were confronted with several extraordinary and startling scenarios. As

a result, online education appears to be a reaction to this problem. Internet teaching has been utilized in various fields for a considerable period, indicating that it is not a new instructional approach. Nevertheless, the utilization of online learning materials remains problematic across all educational levels, including K-12 and higher education (Whelan & Eileen, 2018). According to students, the main barriers to online learning are a lack of social and technological concerns, as well as the complexity of grasping instructional objectives (Dhawan, 2020). Other challenges include teachers' incapacity to deliver and manage students' synchronous or asynchronous meetings, as well as develop realistic online evaluation methodologies as part of the transition from traditional meetings to online platforms (Cochran, 2015). Other challenges may have a big impact on pupils' views. Boredom, disengagement with learning materials, diminished learning process efficacy, and dissatisfaction are all possible effects of a lack of direct connection and physical experience in online learning (Suryani & Sugianingrat, 2021).

On the other hand, student satisfaction is a reliable indicator of online learning quality (Basith et al., 2020). Satisfaction assessment provides valuable data for improving the academic environment (Hanaysha et al., 2011). Service quality in education is evaluated through students' ratings of the services they receive. Student satisfaction is contingent upon the degree to which the level of support offered corresponds with their initial anticipations. However, their level of satisfaction increases significantly when the service surpasses their initial expectations. Furthermore, students experience immense joy when they receive more assistance than they had anticipated. To maximize the value of online education programs, faculty in charge of online learning design and development should include student pleasure (Andersen, 2013).

Therefore, the role of teachers is equally important (Malik & Mubeen, 2009). The comfort of students in an online setting is contingent upon the promptness of teacher responses, which is primarily influenced by the teacher's attitude towards online learning. Assessing students' satisfaction can be utilized as an assessment of the efficiency of an online English learning environment. Furthermore, one of the most important factors in predicting academic progress is student satisfaction (Pham et al., 2018). Poorly designed courses, monitoring mechanisms, and online education style may lead to low academic accomplishment and disinterest in this format (Woodworth et al., 2015). This is why the researchers are curious about the relationship between EFL pre-service teachers' satisfaction with online English learning and academic accomplishment.

2. Literature Review

2.1 Pre-service Teachers' Satisfaction

In academic settings, Satisfaction refers to the degree of contentment experienced by students with various college-related issues such as teaching quality, course accessibility, and classroom management. Pre-service Teachers' Satisfaction is a transient sentiment that arises from evaluating students' learning experiences (Elliott & Healy, 2001). Pre-service Teachers' Satisfaction can also convey a biased evaluation of how well a learning environment aids their academic accomplishments (Osman et al., 2017). It is also a brief-period behavior resulted from an assessment of students' academic involvement, essential services, and resources (Weerasinghe & Fernando, 2017).

Pre-service Teachers' Satisfaction is commonly affiliated with processes, university staff, procedures, and institutional support. Numerous scientific studies have emphasized the importance of students' conceptions of their educational process in deciding student satisfaction (Pedro et al., 2018). Pre-service teachers tend to give satisfactory scores to courses and teachers. It happens if they presume their teachers communicate effectively, promote their learning, manage courses efficiently, actively engage in pre-service teachers' performance and development, respect students, and appropriately evaluate students' work (Gray & DiLoreto, 2016).

2.2 Pre-service Teachers' Satisfaction with Online English Learning

Along within the advancement of technology in distance learning and the emergence of digital teaching systems, pre-service teachers' satisfaction with online learning requires to be assessed. Furthermore, satisfaction with online learning is quite multifaceted. It comprises numerous aspects, such as communication, students' involvement in online conversations, technology assistance, flexibility, responsibility, teachers' pedagogical knowledge, and response; all facets shape students' satisfaction (Elshami et al., 2021).

Online learning satisfaction encompasses various elements, in particular online English learning, including learning objectives, pre-service teachers' evaluation and assessment, educational resources and materials, learner interactions (involving teachers, students, and content), and course technology (Aman, 2009). The online learning environment, the university support throughout the COVID-19 disease, the online schooling method, and the platforms used heavily contribute to students' satisfaction (Almusharraf & Khahro, 2020). Student satisfaction is a reliable indicator of online learning quality (Basith et al., 2020). Student performance substantially improved in online learning than traditional learning, as evidenced by greater course completion rates, satisfaction, and motivation beyond their learning process (Bernard et al., 2014).

The key issues affecting online ESP learning during COVID-19 are also connected to technological, intellectual, and communication issues. Research by Ryan and Poole (2019) investigated the power of online learning settings on students' satisfaction, engagement, recollection, and retention. The data uncovered that the use of online learning progressively impacted pre-service' satisfaction in learning, as observed from the improvement of student satisfaction at the end of the measurement.

2.3 Academic Achievement

Academic achievement is an excellent indicator of student satisfaction during teaching and learning. Academic achievement is the level of development undertaken by students in areas such as knowledge, skills, attitudes, and values over a period under the teacher's guidance and relying on their prior experiences (Tian & Sun, 2018). Academic achievement is the outcome of performance that demonstrates the extent to which an individual has talented explicit academic objectives that have become the target of activities in the educational environment, particularly in schools, campuses, and universities (Crede et al., 2015).

Academic achievement and accountability can assess a person's learning outcomes. Learning outcomes will be influenced by the education system's goals and mission. It implies that learning outcomes can extend beyond cognitive assessments to include performance interventions. It is reasonable to conclude that the student's academic performance results

from a learning process in which students have been involved for one year or semester (GPA) (Wildan, 2013). Academic achievement is something that students would like to achieve within a particular time frame in an academic institution, such as a school, college, or university (Benazir & Fauzia, 2013). Academic accomplishment among students is required to generate high-quality graduate students who will serve as good leaders and workers for the country, completely accountable for the country's social and economic progress. (Dhaqane & Afrah, 2016). Thus, it can be inferred that academic achievement can be used as the controlling point of what students have learned.

2.4 Review of Previous Studies

To date, some scholars have already conducted a study on pre-service teachers' satisfaction and learning environment. For instance, Yekefallah et al. (2021) examined the causes that impact student satisfaction in e-learning amidst the COVID-19 pandemic. The study conducted in Iran involved 200 university students and found that they were dissatisfied with online learning for various reasons, such as feedback, flexibility, workload, and assessment. Then, Asvheniuk et al. (2021) researched the students' satisfaction in ESP classes from three departments of Taras Shevchenko National University of Kyiv. The result revealed that students are primarily satisfied with online ESP classes.

Furthermore, the researchers noticed a gap in some parts given three previous prior research. Even though the prior research tries to determine the students' satisfaction and its factor in online learning, very few have discussed students' satisfaction with online learning and its relation towards students' academic achievement in the Indonesian contexts. Indeed, finding to what extent the interconnection of the two variables can take the benefits by having crucial aspects to evaluate their online learning. Therefore, this study is conducted to provide broad and specific views on the interconnection of online learning academic achievement with students' satisfaction under correlational study. This current research, further, formulates the research under three research questions which presented below:

1. How is the level of satisfaction among EFL pre-service teachers regarding online learning during the COVID-19 pandemic?
2. How is the level of academic achievement among EFL pre-service teachers?
3. How is the correlation between EFL pre-service teachers' satisfaction with online learning during the COVID-19 pandemic and their academic achievement?

The hypothesis that guides the current research is that students' satisfaction in online learning has a strong correlation with the students' achievement.

3. Research Methodology

3.1 Research Design

The researchers chose a quantitative methodology to find out the relationship between students' satisfaction and academic achievement. Furthermore, this present study utilized a correlational design to gather the data. This study utilized an exploratory design to focus on measuring two variables and evaluating the statistical relationship between them, rather than seeking to establish a cause-and-effect relationship. The study was conducted at a private university in Yogyakarta, which implemented both synchronous and asynchronous

online learning methods, particularly during the Covid-19 pandemic. Additionally, the choice of this setting was established on its convenient accessibility and practicality.

3.2 Participants

Convenience sampling was used as a sampling technique in this research. The population for this study was 198 batch 2019 EFL pre-service teachers of the English department at a private university in Yogyakarta because they felt both online and offline learning. The researchers chose a confidence level of 95% and a confidence interval of 3% set by (Cohen et al. 2011) in determining the number of the participants. Hence, if the total population of EFL pre-service teachers of batch 2019 is 198, the minimum sample obtained would be 132 students. At the end, this study was participated by 147 students.

3.3 Instruments

Two instruments were used for this study: a questionnaire and a document. The questionnaire comprised three sections, their satisfaction with the online learning environment, their satisfaction with school support, and their perception of effective online learning approaches and media. The questionnaire was adapted from Norah and Khahro (2020)'s research "Students' Satisfaction with Online Learning Experiences during the COVID-19 Pandemic".

3.4 Data Analysis Procedures

Pearson correlation was used to analyze the data, and the Normality Test was utilized to evaluate the correlation between two variables. To address the third research question, inferential statistics were used to analyze the possible correlation between students' satisfaction in learning and their academic achievement. Hence, inferential statistics were chosen as the preferred method for addressing the third research inquiry. This study utilized the Pearson correlation coefficient (r-value) to analyze the data outcomes, as indicated by the table in SPSS. A correlation results below 0.05 indicates support for the alternative hypothesis (H₁). According to Cohen et al. (2011), low or near zero values indicate weak links, while values closer to +1 or -1 indicate stronger relationships.

4. Findings

4.1. EFL pre-service teachers' satisfaction with online English learning

This section examines the satisfaction of EFL pre-service teachers with the online English learning provided by the university. The researchers employed descriptive statistics to elucidate the level of satisfaction among students regarding online English learning. The satisfaction index developed by Fitriana et al. (2014) was used to categorize the results and determine the level of students' satisfaction based on the questionnaire data. The level of student satisfaction was divided into 5 categories; not satisfied, slightly satisfied, satisfied enough, satisfied, and very satisfied.

Table 1. Section 1 Results (EFL pre-service teachers' satisfaction level by the online English learning environment)

Point 1	Point 2	Point 3	Point 4	Point 5	Point 6	Point 7	Point 8	Point 9
---------	---------	---------	---------	---------	---------	---------	---------	---------

Mean	3.9167	4.0530	3.8636	3.3409	3.6894	3.4848	3.3561	3.7879	3.6667
N	132	132	132	132	132	132	132	132	132
Std. Deviation	.82925	.74459	.88906	1.01763	.88354	.94493	.98176	.85632	.93830

Descriptive Statistics	N	Minimum	Maximum	Mean	Std. Deviation
Mean Section 1	132	1.33	5.00	3.6842	.66415
Valid N (listwise)	132				

In the initial section of the questionnaire, the researchers examined the satisfaction of EFL pre-service teachers with the online English learning environment during the pandemic. All points scored below the average mean of 2.61, indicating a level of satisfaction that is not sufficient. The section's mean score was 3.68, with a standard deviation of 0.664. During the pandemic, the students voiced their contentment with the environment provided by online learning.

Table 2. Section 2 Results (EFL pre-service teachers' satisfaction with the faculty's assistance related to online English learning)

	Point 10	Point 11	Point 12	Point 13	Point 14
Mean	4.0985	3.5682	3.8636	3.6288	4.0985
N	132	132	132	132	132
Std. Deviation	.81830	.95863	.89760	1.04411	.83675

Descriptive Statistics	N	Minimum	Maximum	Mean	Std. Deviation
Mean Section 2	132	2.20	5.00	3.8515	.69967
Valid N (listwise)	132				

The second section analyzed the students' satisfaction with the faculty assistance related to online English learning throughout the disease. None of the points reached the average mean under (3.40/ Satisfied Enough). The mean score of this part was 3.85, while the standard deviation score was 0.699. All students appeared to be "satisfied" with the institution's assistance, e.g., IT problems, online class login problems, academic guidance, bridging events, and social and mental counseling.

Table 3. Section 3 Results (EFL pre-service teachers' perceptions of the most effective online English learning techniques and media)

	Point 15	Point 16	Point 17	Point 18	Point 19	Point 20
Mean	2.8030	4.1061	3.2045	3.9924	3.8561	3.3939
N	132	132	132	132	132	132
Std. Deviation	1.28669	1.02083	1.22779	.89525	.91745	.97101

Descriptive Statistics	N	Minimum	Maximum	Mean	Std. Deviation
Mean Section 3	132	1.67	5.00	3.5592	.60149
Valid N (listwise)	132				

The third section recommended the most valuable online English learning techniques and programs. EFL pre-service teachers strongly preferred the blended learning classrooms (4.01/ Satisfied) rather than only online classes (2.80/ Satisfied Enough) or face-to-face (3.20/ Satisfied Enough). While for the most effective online platforms, they were more satisfied with Microsoft Teams (3.99/ Satisfied). The average score for the segment was 3.55, while the standard deviation was 0.601. This suggests that the students are pleased with the online English classes as well as the methods utilized for delivering the lectures and assessing their comprehension of the material.

Table 4. Descriptive statistics result of the questionnaire

	N	Minimum	Maximum	Mean	Std. Deviation
Students_Satisfaction	132	2.05	5.00	3.6886	.56540
Valid N (listwise)	132				

The descriptive statistical analysis of the 20 questionnaire points was presented above. The greatest score was 5.00, and the smallest score was 2.05. The mean of EFL pre-service teachers' satisfaction scores was 3.68, while the standard deviation score was 0.565. According to the statistics, it appears that the majority of them completed the pandemic feeling satisfied with their progress in online English courses. The inference is that students had a positive experience overall with the online English learning environment, the support they received from the university, as well as the methods and media that were utilized throughout the COVID-19 pandemic.

4.2. EFL pre-service teachers' Academic Achievement

The researcher measured students' academic achievement utilizing their Grade Point Average (GPA). The descriptive statistical analysis was employed to discover 132 EFL pre-service teachers' academic achievement levels. The table is shown below.

Table 5. Descriptive statistics result of the students' GPA

	N	Minimum	Maximum	Mean	Std. Deviation
GPA	132	1.10	3.98	3.3833	.58894
Valid (listwise)	N 132				

The table above shows that the highest GPA was 3.98, while the lowest was 1.10. The mean score of the EFL pre-service teachers' GPA was 3.38, and the standard deviation score was 0.588. Therefore, the result showed that the student's GPA was categorized as "high/ very satisfactory" according to the university GPA classification.

4.3. The correlation between EFL pre-service teachers' satisfaction with online English learning towards their academic achievement

The researchers checked the normality of the data before assessing the correlation between the two (2) variables. The normality of the instruments was determined using a one-sample Kolmogorov-Smirnov test.

The normality tests. The researchers used a normality test to determine if the two data variables' distributions were normal or not. The data exhibited normal distribution for magnitude values greater than 0.05. Data were considered non-normally distributed when the significance value was less than 0.05 (0.05). The normality test confirmed that the data distribution was normal.

Table 6. The Result of The Normality Test

One-Sample Kolmogorov-Smirnov Test		Questionnaire	GPA
N		132	132
Normal Parameters ^b	Mean	3.6886	3.3833
	Std. Deviation	.56540	.58894
Most Extreme Differences	Absolute	.074	.157
	Positive	.074	.155
	Negative	-.042	-.157
Test Statistic		.074	.157
Asymp. Sig. (2-tailed)		.074 ^c	.000 ^c

The research data presented in the table indicated a significant value of 0.074. The observed value of 0.074 in this case exceeded the threshold of 0.05 ($0.074 > 0.05$), indicating that the data obtained in the current study were within the expected range. The observed GPA value of 0.00 was found to be statistically insignificant, as it was smaller than the predetermined significance level of 0.05 ($0.00 > 0.05$). The analysis revealed that the GPA data did not follow a normal distribution.

Data Screening

a. Questionnaire.

The result shows there is no missing data. It indicates that all the respondents answered the statements provided in the questionnaire.

b. GPA Document.

The result also indicated that no missing data was found during data screening analysis.

Hypothesis test. The current investigation seeks to examine the potential relationship between EFL pre-service teachers' satisfaction with online English learning and their academic performance as measured by their GPA. The test aimed to confirm the hypothesis of the study. Given the non-normal distribution of the GPA data, the researchers opted to employ Kendall's Tau Correlation. Kendall's Tau Correlation (τ) was used to assess the level of dependence between the two variables. The correlation result is as follows.:

Table 7. The Result of Hypothesis Test

Correlations			Students_Satisfaction	GPA
26 Kendall's tau_b	Students_Satisfaction	Correlation Coefficient	1.000	.023
		Sig. (2-tailed)	.	.704
		N	132	132
3 GPA		Correlation Coefficient	.023	1.000
		Sig. (2-tailed)	.704	.
		N	132	132

According to the table above, there were 132 total samples (N) in the center of the two variables, Kendall's correlation value (-value) was 0.023, and the significant value (-value) was 0.704. The hypothesis testing was evaluated by considering the significance level. Cohen et al. (2011) found a statistically significant relationship between the coefficient statistics when the p-value was less than 0.05. The obtained result indicated that the p-value was 0.704, which exceeded the threshold of 0.05 ($0.704 > 0.05$). The study's findings indicated that the alternative hypothesis was rejected. No significant correlation was found between EFL pre-service teachers' satisfaction with online English learning and their academic achievement.

5. Discussion

The study results showed that EFL pre-service teachers were content with the university's online learning platform. Various factors influence pre-service teachers' satisfaction, such as the quality of institutional services, extra-curricular activities, and non-academic support services that affect students' well-being in online learning. This finding aligns with the findings of Tan et al. (2016). The study found that the interaction component, particularly the activities in online learning, has a significant impact on students' satisfaction, as determined

by the three factors that were examined. Gopal et al. (2021) conducted a study with similar results. The study aimed to identify the independent variables associated with online learning. The study found that the learning design has a significant impact on students' satisfaction, teacher quality, teacher feedback, and students' prospects. Almusharraf and Khahro (2020) discovered that postsecondary students in the Kingdom of Saudi Arabia (KSA) expressed satisfaction with online learning platforms and experiences amid the COVID-19 pandemic. This aligns with previous research that has also considered factors such as the institution and non-educational services. They discovered that when there was a technical issue during online sessions, institutional help made students feel more at ease. Also, providing online self-improvement seminars throughout the epidemic has raised student happiness in online classrooms. By stating so, this current research, to some extent, is trying to enrich the discussion of providing non-educational services for students. Varying online learning activities and providing technical service when there is an issue are essential aspects of maintaining students' satisfaction throughout online learning.

The second finding relates to the EFL pre-service teachers' first choice for online learning. The current research found that they preferred to have blended learning. In this sense, students preferred to have half of the online and offline learning for their learning process. Even though online learning, at the time of data collection, had been conducted for over two years, still, students chose to have face-to-face meetings. It is reasonable, given that Albiladi and Alshareef (2019) discovered that blended learning might be utilized successfully to strengthen language abilities, improve the English learning environment, and increase students' willingness to study the language. In addition, Qindah (2018) discovered that integrating learning, e.g., online and face-to-face meetings, may increase students' grammatical competency. By underlying the findings mentioned above, most EFL pre-service teachers in this current research preferred blended learning as the best learning mode.

The final finding pertains to the relationship between EFL pre-service teachers' satisfaction with online English learning and their academic Achievement. This study observed that there was no statistically significant correlation between their satisfaction with online English learning and their academic achievement amidst the COVID-19 pandemic. The findings align with Khan and Iqbal's (2016) study on the correlation between pre-service teachers' satisfaction and academic performance in an online educational context. The study findings indicate a lack of statistically significant correlation between EFL pre-service teachers' satisfaction and academic achievement. Dhaqane and Afrah (2016) discovered a noteworthy association between student satisfaction and academic achievement.

6. Conclusion

One crucial aspect that is always involved and influenced in the teaching and learning process is students. Pre-service teachers perform an essential role in seeing the success of the delivery of knowledge by teachers. Teachers should pay attention not only to what is given to students but also to how students feel during the teaching and learning activity itself. The pre-service teachers' level of satisfaction has become the primary topic for researchers in a competitive learning environment due to its strong influence on student academic achievement, which can indirectly use to measure an educational institution's learning success.

13

28 This study investigated the correlation between EFL pre-service teachers' satisfaction with online learning during 19 the COVID-19 pandemic and their academic performance, as assessed by their GPA. This study utilized a quantitative approach and employed a correlational research design. The data underwent statistical analysis using a software application. The questionnaire consisted of three sections that evaluated pre-service 38 teachers' satisfaction regarding the online learning environment, school support for online learning, and the efficacy of different online learning methods and platforms. The mean values for each section were 2.61, 3.40, and 3.99, respectively.

The overall EFL pre-service teachers' satisfaction had a mean value of 3.68, which was categorized as "satisfied". In addition, the student's GPA got a mean value of 3.38, categorized as "good". At the end, the significant value was found to be 0.704, which was larger than 0.05 ($0.704 > 0.05$). Consequently, it indicated that the alternative hypothesis was declined. Thus, there was no relation on each variable.

Lastly, although there is no correlation between the two variables, paying attention to the pre-service teachers' satisfaction during online learning is strongly needed. Their satisfaction will significantly impact other aspects outside academic achievement. Future researchers may look into the same topics using a larger number of participants with more diverse academic backgrounds. Besides, different data analyses will result in richer and more valuable discussions.
